

Cluster-Single-star interaction

Alexey A. Mints

(ARI + St.Petersburg State University)

work was started with **Bert Bastijns** at MODESTa
summer school in late July 2005

Hoher List meeting, Nov. 25-27 2005

What we have

- ★ Star cluster of 20-50 stars + 1 single star coming from infinity
- ★ “Head-on” collision
- ★ STARLAB package + some scripts
- ★ Long-range target: study of cluster-field interaction with direct N-body simulation (NBODY6++).

What's happening

- ★ **Field stars are coming from some distance, and are, or are not, captured by the cluster...**

Catch me, if you can.

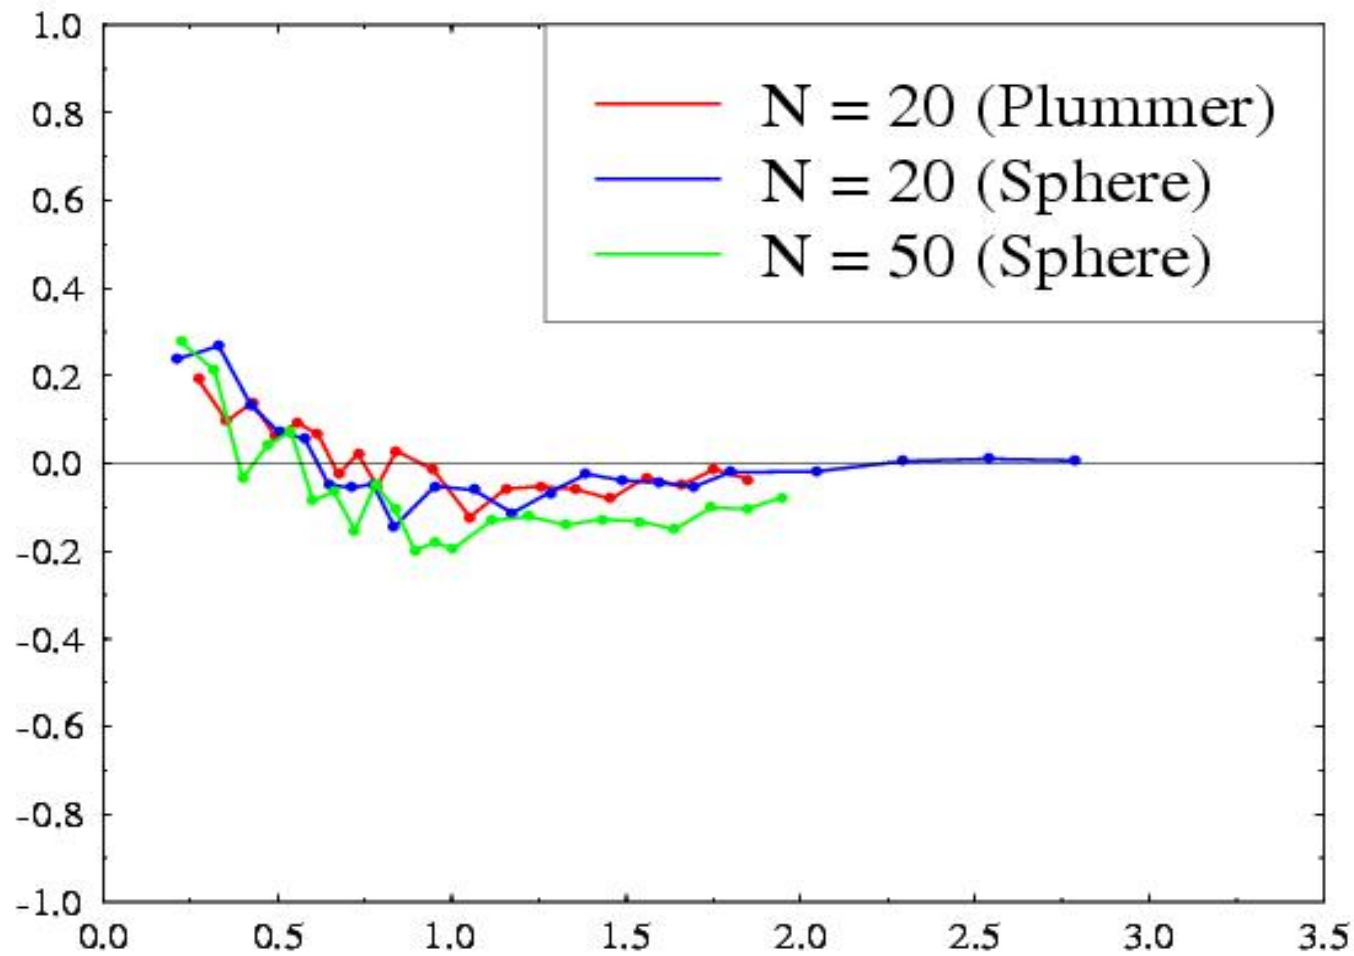

Hoher List meeting, Nov. 25-27 2005

What's happened

- ★ Field stars are coming from some distance, and are, or are not, captured by the cluster...
- ★ **If they were not captured, then their velocity was changed**
- ★

Velocity change

Velocity change: with error bars

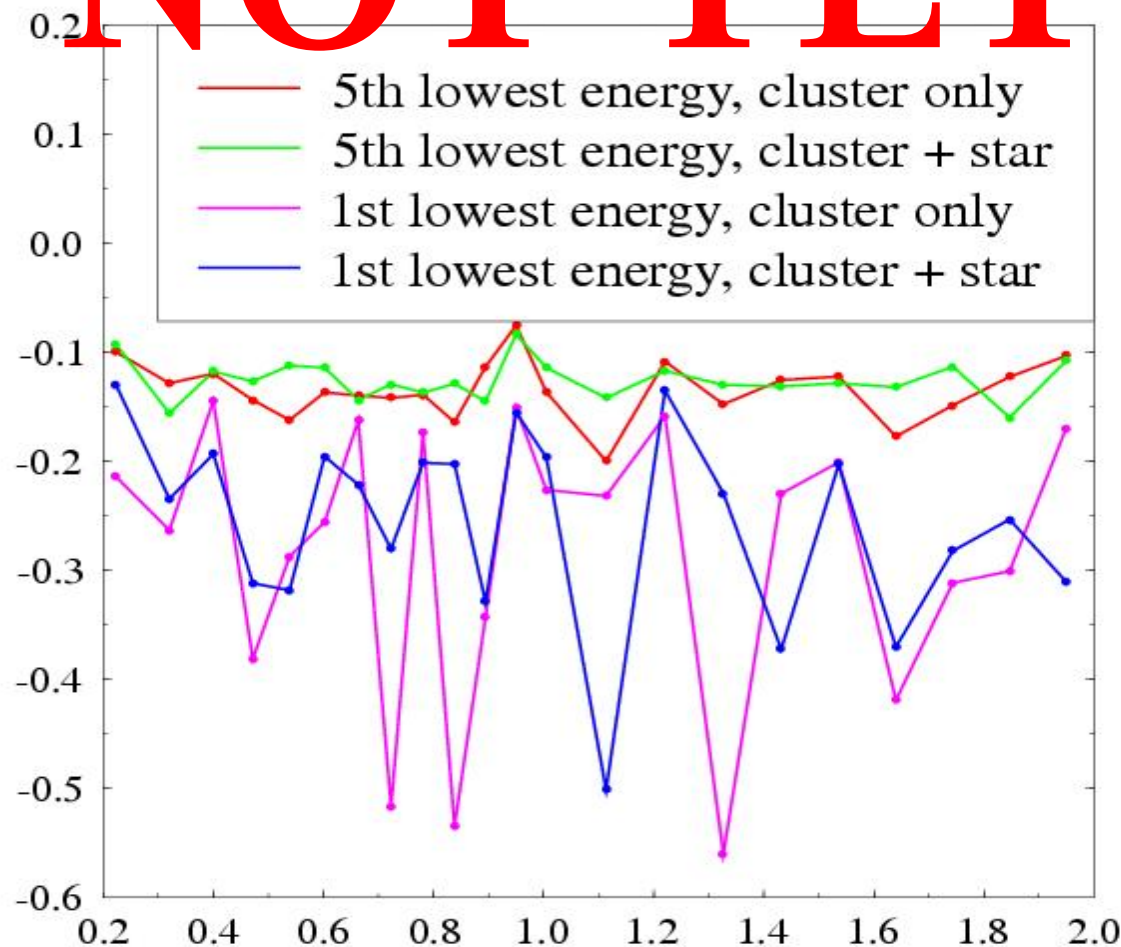

What's happened

- ★ Field stars are coming from some distance, and are, or are not, captured by the cluster...
- ★ If they were not captured, then their velocity was changed
- ★ **Is cluster binary population affected?**

Looking at binaries: can You see the difference?

NOT YET

Future plans

- ★ NBODY6++ full simulation
- ★ One should treat field stars carefully... or not. 8-)
- ★ Binaries inside & outside the cluster
- ★ Moving cluster => “Tidal tail”

Thank You for attention
